ERM[®]-CC018 (Certification Report)

Summary

This report describes the certification of a reference material for the determination of aqua regia extractable mass fractions of As, Cd, Co, Cr, Cu, Hg, Ni, Pb, V and Zn in a contaminated sandy soil.

The certified reference material ERM[®]-CC018 is intended for the verification of analytical results obtained by standardised procedures as well as for the validation of modified or new analytical methods.

The following mass fractions were certified:

Analyte	Aqua regia extractable mass fraction in mg/kg ¹⁾ (extraction according to ISO 11466)	
	Certified value ²⁾	Uncertainty ³⁾
Arsenic	22.9	± 1.3
Cadmium	5.4	± 0.5
Chromium	129	± 6
Cobalt	5.9	± 0.4
Copper	80	± 4
Lead	289	± 10
Mercury	1.38	± 0.06
Nickel	25.8	± 1.8
Vanadium	19.4	± 1.0
Zinc	313	± 13

¹⁾ All results are corrected to the dry mass content of the material determined after drying to constant mass at (105 ± 2) °C.

²⁾ Unweighted mean value of the means of accepted sets of data obtained in different BAM working groups using different methods of determination. The certified values are traceable to the SI (Système International d'Unités) via calibration using substances with certified purity.

³⁾ Estimated expanded uncertainty U with a coverage factor $k = 2.5$, corresponding to a level of confidence of approximately 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM, ISO/IEC Guide 98-3:2008).

ERM[®]-CC018 is provided as a powder with particle sizes below 63 µm in a 100 mL screw-capped brown glass bottle containing (55 ± 1) g. The minimum amount of sample to be used for the determination of aqua regia extractable mass fractions of elements is 3 g (as prescribed by ISO 11466).

The certified values are valid for a period of 12 months beginning with the dispatch of the reference material from BAM.

1 Introduction

The determination of element contents of soils after extraction with aqua regia according to ISO 11466 [1] is a very common analytical task in the daily practice of testing laboratories involved in the assessment of environmental pollution. In many countries it is prescribed by legislation which also demands that the reliability of measurement results must be assured by appropriate quality control.

A very useful tool for internal quality assurance is the analysis of certified reference materials (CRM). However, in this context it is important to note that the used CRMs should match the matrix composition of the samples to be tested as close as possible. Given the wide variation of “real world” soils in terms of their mineral components, organic matter and anthropogenic contamination, there is a need for a wide range of different soil reference materials. Hence, ERM[®]-CC018 was certified to complement available offers of appropriate CRMs for inorganic soil analysis.

2 Candidate material

The starting material for preparing ERM[®]-CC018 was a sandy soil collected from a stockpile excavated during a remediation campaign on an industrial wasteland in the Berlin region (Germany). The raw material was dried at ambient air to constant mass and afterwards the fraction passing a 2 mm screen was ground in a ball mill (with grinding bowls and balls made of zirconia) completely to particle sizes below 63 µm. Homogenisation and bottling of the ground material was performed using a spinning riffler according to the so-called “cross-riffing scheme” [2]. A total of 256 bottles each containing (55 ± 1) g was produced in March 2009 and stored at (20 ± 3) °C.

3 Homogeneity study

10 bottles were chosen using a random sample picking scheme following the sequence of bottling. The selected units were analysed in duplicate each using sample intakes of 3 g and also of 0.5 g. For trace element determination the soil material was extracted

- (a) with aqua regia according to ISO 11466 under reflux conditions using a sample intake of 3 g,
- (b) with aqua regia (9 mL HCl + 3 mL HNO₃) using a closed vessel microwave system and a sample intake of 0.5 g.

Solutions obtained according to (a) or (b) were analysed under repeatability conditions after randomisation in one run with one calibration, respectively. All measurement results and used analytical methods are given in Annex 2.

The estimates of analyte-specific inhomogeneity contributions u_{bb} to be included into the total uncertainty budgets were calculated according to ISO Guide 35 using Eq. (1) and (2):

$$s_{bb} = \sqrt{\frac{MS_{\text{among}} - MS_{\text{within}}}{n}} \quad (1)$$

$$u_{bb}^* = \sqrt{\frac{MS_{\text{within}}}{n}} \sqrt[4]{\frac{2}{N(n-1)}} \quad (2)$$

where:

MS_{among}	mean of squared deviations between bottles (from 1-way ANOVA)
MS_{within}	mean of squared deviations within bottles (from 1-way ANOVA)
n	number of replicate sub-samples per bottle
N	number of bottles selected for homogeneity study

ERM[®]-CC018 (Certification Report)

s_{bb} signifies the between-bottle standard deviation, whereas u_{bb}^* denotes the maximum heterogeneity that can potentially be hidden by an insufficient repeatability of the applied measurement method (which has to be considered as the minimum uncertainty contribution). In any case the larger of the two values was used as u_{bb} . Eq. (1) does not apply if MS_{within} is larger than MS_{among} .

The calculated relative values of s_{bb} , u_{bb}^* , and u_{bb} referring to the different sample intakes are given in the following table.

Table 1: Relative uncertainty contributions $s_{bb,r}$, $u_{bb,r}^*$, and $u_{bb,r}$

Analyte	Sample intake 3 g (a)			Sample intake 0.5 g (b)		
	$s_{bb,r}$ (%)	$u_{bb,r}^*$ (%)	$u_{bb,r}$ (%)	$s_{bb,r}$ (%)	$u_{bb,r}^*$ (%)	$u_{bb,r}$ (%)
Arsenic	0.81	0.77	0.81	$MS_{among} < MS_{within}$	1.54	1.54
Cadmium	$MS_{among} < MS_{within}$	0.62	0.62	$MS_{among} < MS_{within}$	1.51	1.51
Chromium	$MS_{among} < MS_{within}$	0.26	0.26	$MS_{among} < MS_{within}$	1.44	1.44
Cobalt	1.04	0.59	1.04	$MS_{among} < MS_{within}$	1.23	1.23
Copper	$MS_{among} < MS_{within}$	0.37	0.37	$MS_{among} < MS_{within}$	1.30	1.30
Lead	$MS_{among} < MS_{within}$	0.43	0.43	$MS_{among} < MS_{within}$	1.26	1.26
Mercury	1.03	0.80	1.03	$MS_{among} < MS_{within}$	2.94	2.94
Nickel	0.53	0.81	0.81	$MS_{among} < MS_{within}$	1.35	1.35
Vanadium	0.43	0.50	0.50	0.38	1.31	1.31
Zinc	$MS_{among} < MS_{within}$	0.16	0.16	$MS_{among} < MS_{within}$	1.52	1.52

As could be expected, larger $u_{bb,r}$ values were obtained for all analytes when the smaller sample intake was used for extraction. Nevertheless, taking into account the analytical protocol prescribed by ISO 11466, the uncertainty contributions u_{bb} which were included in the calculation of the expanded uncertainties of the certified mass fractions refer to a sample intake of 3 g.

4 Stability study

Based on many years of experience gained at BAM with reference materials for inorganic soil analysis it is very unlikely that aqua regia extractable mass fractions of elements will change if the samples are stored and handled properly. For this reason only a reduced stability check of the bottled material was performed.

Immediately after bottling selected units were stored at temperatures of -20 °C, +20 °C and +40 °C, respectively. After a storage time of 12 months two bottles per temperature were analysed in duplicate for aqua regia extractable mass fractions applying extraction procedure (a). The extraction solutions were analysed under repeatability conditions in one run with one calibration. The measurement results (see Annex 3) were evaluated for each analyte calculating the ratios R_t (3) and their uncertainties u_t (4):

$$R_t = X_t / X_{-20\text{ °C}} \quad (3)$$

$$u_t = (CV_t^2 + CV_{-20\text{ °C}}^2)^{1/2} \cdot R_t \quad (4)$$

where X_t and $X_{-20\text{ °C}}$ are the mean values of four analyses of samples stored at temperature t (+20 °C or +40 °C) and of samples stored at the reference temperature -20 °C, respectively. CV_t and $CV_{-20\text{ °C}}$ are the corresponding coefficients of variation.

ERM[®]-CC018 (Certification Report)

If one postulates that aqua regia extractable mass fractions of samples stored at -20 °C do not change over time, in case of ideal sample stability at a higher storage temperature t the ratio R_t should be 1. In reality, however, unavoidable random variations of measurement results have to be taken into account. Thus, a material can be considered stable at storage temperature t if the value 1 is comprised between $R_t - u_t$ and $R_t + u_t$. This precondition is fulfilled for all analytes and storage temperatures under test.

Table 2: Results of the stability test after a storage time of 12 months

Analyte	$R_t \pm u_t$	
	Samples stored at 20 °C	Samples stored at 40 °C
Arsenic	0.9964 ± 0.0090	1.0016 ± 0.0092
Cadmium	1.0238 ± 0.0243	1.0206 ± 0.0227
Chromium	0.9961 ± 0.0061	1.0000 ± 0.0022
Cobalt	1.0065 ± 0.0215	1.0002 ± 0.0254
Copper	0.9975 ± 0.0115	1.0005 ± 0.0071
Lead	0.9997 ± 0.0133	1.0010 ± 0.0157
Mercury	1.0165 ± 0.0383	0.9935 ± 0.0116
Nickel	0.9996 ± 0.0206	0.9996 ± 0.0221
Vanadium	1.0125 ± 0.0271	1.0105 ± 0.0294
Zinc	1.0017 ± 0.0072	0.9973 ± 0.0061

As no trend and no statistically significant impact of storage conditions on the stability of the certified properties could be detected and taking into account the small uncertainties u_t , an expansion of the total uncertainty of the certified values by a long-term uncertainty contribution u_{its} was not considered necessary.

Stability testing will be continued by further measurements of units stored at -20 °C, +20 °C and +40 °C over the period of availability of the material. Thus, the validity of the expiration date of one year after dispatch given in the certificate is maintained by post-certification measurements starting at BAM.

5 Certification study

5.1 Participants and used analytical methods

Three BAM working groups with a total of 12 independent operator/equipment combinations were involved in the characterisation of the candidate material. All of them are operating a quality management system accredited to ISO/IEC 17025 [4].

The following analytical methods were used:

- Cold-vapour atomic absorption spectrometry (CV AAS)
- Cold-vapour atomic fluorescence spectrometry (CV AFS)
- Electrothermal atomic absorption spectrometry (ET AAS)
- Flame atomic absorption spectrometry (F AAS)
- Hydride generation atomic absorption spectrometry (HG AAS)
- Inductively coupled plasma optical emission spectrometry (ICP OES)
- Inductively coupled plasma mass spectrometry (ICP-MS)
- Solid sampling advanced mercury analyzer (AMA)

ERM[®]-CC018 (Certification Report)

As aqua regia extractable mass fractions of elements are operationally-defined parameters, extraction of the soil sample was performed strictly following the analytical protocol prescribed by ISO standard 11466 [1].

Each participating working group received two units of the bottled candidate material and had to analyse two independent sub-samples from each unit. In addition, the dry mass content of the material had to be determined on separate sub-samples by drying to constant mass at $(105 \pm 2) ^\circ\text{C}$ according to ISO 11465 [5]. All reported aqua regia extractable mass fraction were corrected to the dry mass content of the soil sample.

5.2 Statistical evaluation of results

The measurement results obtained with the different operator/equipment combinations (identified by a "WG & method code") are compiled in Annex 1. The bars in the graphic presentations indicate the standard deviation of individual results. The bars associated with the also plotted certified values represent the corresponding expanded uncertainties.

Statistical tests and data evaluation were performed using software SoftCRM version 1.2.2 [6]. The following tests were carried out:

Scheffé's multiple t-test: All data sets compatible two-by-two?

Cochran test: Outlying variances?

(Significance levels 0.01 and 0.05, respectively. Outlying data sets are indicated.)

Grubbs, Dixon and Nalimov tests: Outlying means?

Bartlett test: Variances homogeneous?

Snedecor F-test: Differences between data sets statistically significant?

Gauß (Kolmogorov-Smirnov-Lilliefors test): Normality of the distribution of the means?

The results of these tests are summarised in Table 4.

Table 4: Statistical tests carried out on participants' results

Analyte	Number of data sets	Statistical tests				
		Scheffe	Cochran (0.01/0.05)	Grubbs (0.01/0.05)	Dixon (0.01/0.05)	Nalimov (0.01/0.05)
Arsenic	7	No	(-/-)	(-/-)	(-/-)	(-/-)
Cadmium	5	No	(-/-)	(-/-)	(-/-)	(-/-)
Chromium	6	No	(-/-)	(-/-)	(-/-)	(-/-)
Cobalt	5	No	(-/06)	(-/-)	(-/-)	(-/-)
Copper	5	No	(-/-)	(-/-)	(-/-)	(-/-)
Lead	6	No	(-/-)	(-/-)	(-/-)	(-/-)
Mercury	4	No	(-/-)	(-/-)	(-/-)	(-/-)
Nickel	6	No	(-/05)	(-/-)	(-/-)	(-/-)
Vanadium	6	No	(-/-)	(-/-)	(-/-)	(-/-)
Zinc	5	No	(-/-)	(-/-)	(-/-)	(-/-)

ERM[®]-CC018 (Certification Report)

Table 4 (continued): Statistical tests carried out on participants' results

Analyte	Statistical tests			Consequence
	Bartlett (0.01/0.05)	Snedecor (0.01/0.05)	Gauß (0.01/0.05)	
Arsenic	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Cadmium	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Chromium	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Cobalt	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Copper	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Lead	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Mercury	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Nickel	Yes/No	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Vanadium	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed
Zinc	Yes/Yes	Yes/Yes	Yes/Yes	Pooling of individual data not allowed

As no technical reasons could be identified for “suspicious” data sets (none of them was flagged as a statistical outlier with a level of confidence of 99 %), all data sets were retained for further data processing.

6 Certified values and uncertainties

The unweighted means of accepted data set means were taken as the best estimates w_{char} for the values to be certified. They are expressed on a dry mass basis corresponding to a drying temperature of $(105 \pm 2) ^\circ\text{C}$. The standard deviations of the means of accepted data set means were taken as uncertainty contributions u_{char} resulting from the characterisation exercise. The different contributions to the overall uncertainties of the certified mass fractions were combined using the following equation:

$$u_{\text{CRM}} = \sqrt{u_{\text{char}}^2 + u_{\text{bb}}^2} \quad (5)$$

Calculated aqua regia extractable mass fractions w_{char} and absolute values of the different uncertainty components are given in Table 5.

Table 5: Mass fractions and uncertainty components for the analytes in ERM[®]-CC018 (before rounding)

Analyte	w_{char} (mg/kg)	u_{char} (mg/kg)	u_{bb} (mg/kg)	u_{CRM} (mg/kg)
Arsenic	22.94	0.4842	0.1851	0.5184
Cadmium	5.378	0.1684	0.0332	0.1718
Chromium	129.1	2.3243	0.3357	2.3484
Cobalt	5.872	0.1408	0.0610	0.1534
Copper	80.21	1.5546	0.2936	1.5821
Lead	289.4	3.7036	1.2386	3.9052
Mercury	1.379	0.0158	0.0142	0.0212
Nickel	25.84	0.6681	0.2091	0.7001
Vanadium	19.42	0.3559	0.0971	0.3689
Zinc	313.3	4.8629	0.4856	4.8871

ERM[®]-CC018 (Certification Report)

The expanded uncertainties U were obtained by multiplying the combined uncertainties u_{CRM} by a coverage factor k :

$$U = k \times u_{\text{CRM}} \quad (6)$$

The value of the coverage factor k was chosen to give a level of confidence of approximately 95 % to be associated with the interval $\pm U$ around the certified values. For approximation of k the effective degrees of freedom ν_{eff} of the linear combinations of u_{char} and u_{bb} were calculated using the Welch-Satterthwaite formula (see [7], Annex G.4). The obtained values for ν_{eff} and the corresponding factors $t_{95}(\nu_{\text{eff}})$ taken from Student's distribution and giving a level of confidence of 95 % are listed in the following table.

Table 6: Effective degrees of freedom of u_{CRM} and corresponding factors $t_{95}(\nu_{\text{eff}})$

Analyte	ν_{eff}	$t_{95}(\nu_{\text{eff}})$
Arsenic	7.77	2.36
Cadmium	4.31	2.78
Chromium	5.21	2.57
Cobalt	5.56	2.57
Copper	4.29	2.78
Lead	6.14	2.45
Mercury	8.05	2.31
Nickel	6.00	2.57
Vanadium	5.74	2.57
Zinc	4.08	2.78

Because all factors $t_{95}(\nu_{\text{eff}})$ were well below 3 and most of them close to 2.5, a coverage factor $k = 2.5$ was chosen for all analytes to give the desired level of confidence of approximately 95 %.

The certified mass fractions and their corresponding expanded uncertainties were rounded according to DIN 1333 [8].

Table 7: Certified mass fractions and expanded uncertainties of analytes in ERM[®]-CC018 (after rounding)

Analyte	Aqua regia extractable mass fraction (mg/kg)
Arsenic	22.9 ± 1.3
Cadmium	5.4 ± 0.5
Chromium	129 ± 6
Cobalt	5.9 ± 0.4
Copper	80 ± 4
Lead	289 ± 10
Mercury	1.38 ± 0.06
Nickel	25.8 ± 1.8
Vanadium	19.4 ± 1.0
Zinc	313 ± 13

ERM[®]-CC018 (Certification Report)

7 Traceability

In the course of trace element determinations all analyses were carried out with matrix matched calibration solutions prepared either from metals of well-defined purity or from commercial solutions with certified element concentrations.

However, due to the fact that an extraction step is necessary prior to the analytical determination it is important to note that the certified mass fractions of ERM[®]-CC018 are operationally defined referring to the analytical protocol prescribed by ISO 11466 [1].

8 Additional data

The main matrix constituents of the bottled material were determined by semi-quantitative X-ray fluorescence analysis giving the following non-certified results:

Element	Si	Al	Ca	Fe	K
Mass fraction in %	38.8	2.1	2.6	1.4	0.9

Further informative analytical results obtained in the course of sample characterisation:

Parameter	Mass fraction in %	Analytical method
Dry mass content at 105 °C	99.1	ISO 11465 [5]
Loss on ignition at 550 °C	4.6	EN 12879 [9]
Total organic carbon (TOC)	2.4	ISO 10694 [10]
Total inorganic carbon (TIC)	0.4	ISO 10694 [10]

pH values in water and CaCl₂ solution (acc. to ISO 10390 [11]): 7.6 and 7.5, respectively.

In October 2009 bottled units of the candidate material were used as test items in the course of a proficiency test (PT) organised for accredited German laboratories. Participants had to analyse the soil sample in duplicate for aqua regia extractable mass fractions. They were requested to follow the extraction procedure prescribed by ISO 11466 [1] but they were free in choosing analytical methods for the determination of the elements under test.

The PT results were evaluated using a robust method of data analysis according to DIN 38402-45 [12]. A summary is given in the following table:

Analyte	PT mean (mg/kg)	s _R in %	s _r in %	N
Arsenic	22.45	7.56	1.80	65
Cadmium	5.423	6.71	1.13	66
Chromium	129.7	5.31	1.46	66
Cobalt	5.977	12.75	1.62	57
Copper	80.35	5.19	1.24	66
Lead	286.9	6.73	1.38	66
Mercury	1.392	9.37	2.73	65
Nickel	25.96	7.71	2.83	66
Vanadium	18.94	8.85	2.16	52
Zinc	313.4	5.36	1.62	66

s_R relative reproducibility standard deviation of laboratory means

ERM[®]-CC018 (Certification Report)

- s_r relative repeatability standard deviation
N number of participating laboratories

The PT results agree within the respective uncertainties with those obtained in the course of the internal BAM certification exercise. Hence, they can be regarded as an additional confirmation of validity of the certified values.

9 Information on the proper use of ERM[®]-CC018

9.1 Shelf life

The initial stability study after storage of selected units at different temperatures did not reveal any statistically significant deterioration of the certified properties. However, starting with dispatch of the material from BAM the validity of the certificate expires after 12 months. Post-certification measurements will be conducted in appropriate periods to keep this information up to date.

9.2 Transport, storage and use

Transportation of the bottled sample does not require special precautions. The stability of the contents of the relevant analytes allows the dispatch of the material at ambient temperature. Short heating of the closed bottle up to +40 °C for a few days does not affect the quality of ERM[®]-CC018.

On receiving, bottled material has to be stored at (20 ± 3) °C in the dark. The material should be used as it is provided. However, before taking a sub-sample a re-homogenisation by manual shaking of the closed bottle is highly recommended. The bottle shall be left unclosed as shortly as possible. BAM cannot be held responsible for changes that happen during storage of the material at the customer's premises, especially of opened samples.

Analytical results have to be corrected to the dry mass content of the material which shall be determined according to ISO 11465 [5] using a separate sub-sample. The dry mass content of 99.1 % (see chapter "Additional data") should be regarded as being indicative only.

9.3 Safety instructions

No hazardous effect is to be expected when the material is used under conditions usually adopted for the analysis of environmental matrices moderately contaminated with trace elements. Nevertheless, it is strongly recommended to handle and dispose the reference material in accordance with the guidelines for hazardous materials legally in force at the site of end use and disposal.

9.4 Legal notice

Neither the BAM Federal Institute for Materials Research and Testing nor any person acting on its behalf make any warranty or representation, express or implied, that the use of any information, material, apparatus, method or process disclosed in this document does not infringe any privately owned intellectual property rights, or assume any liability with respect to, or damages resulting from, the use of any information, material, apparatus, method or process disclosed in this document.
